

# Activity 1: Introduction to NLP basic techniques

## Instructions:

---

- Provide explanations for cells which you code in the tutorial by adding a text below the code cell.
- Note: your explanation must include how the code works and libraries used and why they are used.
- Submit **.ipynb and pdf**(do not use Ctrl+p to generate pdf, use some external ipynb to pdf converters Ex:onlineconvertfree.com, vertopal.com.etc ) to canvas.
- The similarity score should be less than 15%

## Good Luck with the first NLP In class tasks 🍀

## Fundamentals of NLP: Tokenization

Natural language processing (NLP) has made substantial advances in the past few years due to the success of [modern techniques](#) that are based on [deep learning](#). With the rise of the popularity of NLP and the availability of different forms of large-scale data, it is now even more imperative to understand the inner workings of NLP techniques and concepts, from first principles, as they find their way into real-world usage and applications that affect society at large. Building intuitions and having a solid grasp of concepts are both important for coming up with innovative techniques, improving research, and building safe, human-centered AI and NLP technologies.

In this first chapter, which is part of a series called **Fundamentals of NLP**, we will learn about some of the most important **basic concepts** that power NLP techniques used for research and building real-world applications. Some of these techniques include *lemmatization*, *stemming*, *tokenization*, and *sentence segmentation*. These are all important techniques to train efficient and effective NLP models. Along the way, we will also cover best practices and common mistakes to avoid when training and building NLP models. We also provide some exercises for you to keep practicing and exploring some ideas.

In every chapter, we will introduce the theoretical aspect and motivation of each concept covered. Then we will obtain hands-on experience by using bootstrap methods, industry-standard tools, and other open-source libraries to implement the different techniques. Along the way, we will also cover best practices, share important references, point out common mistakes to avoid when training and building NLP models, and discuss what lies ahead.

---

## Tokenization

With any typical NLP task, one of the first steps is to tokenize your pieces of text into its individual words/tokens (process demonstrated in the figure above), the result of which is used to create so-called vocabularies that will be used in the language model you plan to build. This is actually one of the techniques that we will use the most throughout this series but here we stick to the basics. Tokenization is a foundational step that transforms raw text into a structured format suitable for various NLP tasks and machine learning applications

Below I am showing you an example of a simple tokenizer without any following any standards. All it does is extract tokens based on a white space separator.

Try to running the following code blocks.

```
In [1]: doc = "I love coding and writing"
for i, w in enumerate(doc.split(" ")): #enumerate() is used to iterate over a sequence while keeping track of
    print("Token " + str(i) + ": " + w)
```

```
Token 0: I
Token 1: love
Token 2: coding
Token 3: and
Token 4: writing
```

All the code does is separate the sentence into individual tokens. The above simple block of code works well on the text I have provided. But typically, text is a lot noisier and complex than the example I used. For instance, if I used the word "so-called" is that one word or two words? For such scenarios, you may need more advanced approaches for tokenization. You can consider stripping away the "-" and splitting into two tokens or just combining into one token but this all depends on the problem and domain you are working on.

Another problem with our simple algorithm is that it cannot deal with extra whitespaces in the text. In addition, how do we deal with cities like "New York" and "San Francisco"?

---

**Q 1:** Copy the code from above and add extra whitespaces to the string value assigned to the `doc` variable and identify the issue with the code. Then try to fix the issue. Hint: Use `text.strip()` to fix the problem.

```
In [2]: ### ENTER CODE HERE
doc = "  I love coding and writing.  "
# doc = doc.strip();
for i, w in enumerate(doc.strip().split(" ")): #enumerate() is used to iterate over a sequence while keeping
    print("Token " + str(i) + ": " + w)
###
```

```
Token 0: I
Token 1: love
Token 2: coding
Token 3: and
Token 4: writing.
```

- `strip()` method removes all the extra spaces at the beginning and end of the string.

---

Tokenization can also come in different forms. For instance, more recently a lot of state-of-the-art NLP models such as [BERT](#) make use of `subword` tokens in which frequent combinations of characters also form part of the vocabulary. This helps to deal with the so-called out of vocabulary (OOV) problem. We will discuss this in upcoming chapters, but if you are interested in reading more about this now, check this [paper](#).

To demonstrate how you can achieve more reliable tokenization, we are going to use [spaCy](#), which is an impressive and robust Python library for natural language processing. In particular, we are going to use the built-in tokenizer found [here](#).

Run the code block below.

**spaCy:** spaCy is an open-source Python library for natural language processing (NLP). It provides tools to efficiently process and analyze text data, offering features like tokenization, part-of-speech tagging, named entity recognition, and more. Known for its speed and accuracy, spaCy is widely used in NLP tasks for extracting insights and information from text.

```
In [3]: ## required libraries that need to be installed
%%capture
!pip install -U spacy
#!pip install -U spacy-lookups-data
!python -m spacy download en_core_web_sm
```

```
In [4]: ## import the libraries
import spacy #opensource lib used for tokenization, lemmatization and provides pre trained models
## load the pre trained language model
nlp = spacy.load("en_core_web_sm") # "en" indicates English, "core" suggests that it's a core language model,

## tokenization
doc = nlp("This is the so-called lemmatization")
for token in doc:
    print(token.text)
```

```
This
is
the
so
-
called
lemmatization
```

---

**NLTK** (Natural Language Toolkit) is a Python library that provides tools and resources for working with human language data, enabling tasks like text processing, analysis, and understanding. It's widely used for various natural language processing tasks, offering functions for tasks like tokenization, part-of-speech tagging, and more

```
In [5]: import nltk
nltk.download('punkt')#Punkt is a pre-trained sentence tokenizer provided by NLTK that can intelligently spl
from nltk.tokenize import word_tokenize #word_tokenize function is used to split a piece of text into indivi
sentence = """At eight o'clock on Thursday morning Arthur didn't feel very good."""
tokens = nltk.word_tokenize(sentence)
tokens
```

```
[nltk_data] Downloading package punkt to /root/nltk_data...
[nltk_data] Unzipping tokenizers/punkt.zip.
```

```
Out[5]: ['At',
'eight',
'o'clock',
'on',
'Thursday',
'morning',
'Arthur',
'didn',
't',
'feel',
'very',
'good',
'.']
```

**Q 2:** Copy the code from above and extend the code to print tokens from the given sentence that have a length greater than 5?

```
In [6]: ##CODE HERE
import nltk
nltk.download('punkt')#Punkt is a pre-trained sentence tokenizer provided by NLTK that can intelligently spl
from nltk.tokenize import word_tokenize #word_tokenize function is used to split a piece of text into indivi
sentence = """At eight o'clock on Thursday morning Arthur didn't feel very good."""
tokens = nltk.word_tokenize(sentence)
tokens
```

```
[nltk_data] Downloading package punkt to /root/nltk_data...
[nltk_data] Package punkt is already up-to-date!
```

```
Out[6]: ['At',
'eight',
'o'clock',
'on',
'Thursday',
'morning',
'Arthur',
'didn',
't',
'feel',
'very',
'good',
'.']
```

```
In [7]: # for token in tokens:
#     if len(token) > 5:
#         print(token)
# <-or->
new_tokens = [token for token in tokens if len(token) > 5]
new_tokens
```

```
Out[7]: ['o'clock', 'Thursday', 'morning', 'Arthur']
```

**Gensim** is a Python library designed for topic modeling and document similarity analysis. It specializes in handling large text corpora efficiently. Gensim provides tools for tasks like topic modeling, word embedding, and document similarity calculation. It's widely used for uncovering hidden patterns in text data and generating insights from unstructured text.

In summary, Gensim is a powerful library in the field of natural language processing (NLP) that focuses on tasks related to text analysis and modeling, such as extracting topics from documents and creating word embeddings.

```
In [8]: #gensim work tokenization
!pip install gensim
from gensim.utils import tokenize
text = """Founded in 2002, SpaceX's mission is to enable humans to become a spacefaring civilization and a m
```

```
species by building a self-sustaining city on Mars. In 2008, SpaceX's Falcon 1 became the first privately developed liquid-fuel launch vehicle to orbit the Earth.""""
list(tokenize(text))
```

```
Requirement already satisfied: gensim in /usr/local/lib/python3.10/dist-packages (4.3.2)
Requirement already satisfied: numpy>=1.18.5 in /usr/local/lib/python3.10/dist-packages (from gensim) (1.23.5)
Requirement already satisfied: scipy>=1.7.0 in /usr/local/lib/python3.10/dist-packages (from gensim) (1.11.4)
Requirement already satisfied: smart-open>=1.8.1 in /usr/local/lib/python3.10/dist-packages (from gensim) (6.4.0)
```

```
Out[8]: ['Founded',
        'in',
        'SpaceX',
        's',
        'mission',
        'is',
        'to',
        'enable',
        'humans',
        'to',
        'become',
        'a',
        'spacefaring',
        'civilization',
        'and',
        'a',
        'multi',
        'planet',
        'species',
        'by',
        'building',
        'a',
        'self',
        'sustaining',
        'city',
        'on',
        'Mars',
        'In',
        'SpaceX',
        's',
        'Falcon',
        'became',
        'the',
        'first',
        'privately',
        'developed',
        'liquid',
        'fuel',
        'launch',
        'vehicle',
        'to',
        'orbit',
        'the',
        'Earth']
```

**Q 3.** Now based on above word tokenizations perform a **sentence** tokenization using spacy or nltk?

```
In [9]: ##CODE HERE
from nltk.tokenize import sent_tokenize
text = """Founded in 2002, SpaceX's mission is to enable humans to become a spacefaring civilization and a multi-planet species by building a self-sustaining city on Mars. In 2008, SpaceX's Falcon 1 became the first privately developed liquid-fuel launch vehicle to orbit the Earth.""""
sentence_tokens = sent_tokenize(text)
sentence_tokens
```

```
Out[9]: ['Founded in 2002, SpaceX's mission is to enable humans to become a spacefaring civilization and a multi-planet species by building a self-sustaining city on Mars.',
        'In 2008, SpaceX's Falcon 1 became the first privately developed liquid-fuel launch vehicle to orbit the Earth.']
```

- nltk library provides sent\_tokenize which can be used to perform sentence tokenization.

All the code does is tokenize the text based on a pre-built language model.

Try putting different running text into the `nlp()` part of the code above. The tokenizer is quite robust and it includes a series of built-in rules that deal with exceptions and special cases such as those tokens that contain punctuations like "" and "-", etc.

You can even add your own rules, find out how [here](#).

In a later chapter of the series, we will do a deep dive on tokenization and the different tools that exist out there that can simplify and speed up the process of tokenization to build vocabularies. Some of the tools we will explore are the [Keras Tokenizer API](#) and [Hugging Face Tokenizer](#).

---

**BeautifulSoup:** BeautifulSoup is a Python library used for web scraping. It helps extract data from HTML and XML documents by providing methods to parse and navigate their content. BeautifulSoup simplifies the process of extracting information from web pages, making it accessible for various data collection and analysis tasks.

```
In [10]: #code block 1  
#import the required libraries  
  
from bs4 import BeautifulSoup  
import urllib.request  
import nltk  
from nltk.corpus import stopwords  
nltk.download('stopwords')
```

```
[nltk_data] Downloading package stopwords to /root/nltk_data...  
[nltk_data] Unzipping corpora/stopwords.zip.
```

```
Out[10]: True
```

First, we will grab a web page content then we will analyze the text to see what the page is about. We will use the urllib module to crawl the web page:

```
In [11]: #code block 2  
  
import urllib.request  
  
#open and read the spacex data  
response = urllib.request.urlopen('http://php.net/')  
html = response.read()  
print(html)
```

```

**Download 8.3.2 · Changelog · Upgrading 8.2.15 · Changelog · Upgrading 8.1.27 · Changelog · Upgrading 18 Jan 2024** PHP 8.2.15 Released! The PHP development team announces the immediate availability of PHP 8.2.15. This is a bug fix release. All PHP 8.2 users are encouraged to upgrade to this version. For source downloads of PHP 8.2.15 please visit our downloads page,

Windows source and binaries can be found on [windows.php.net/download/](https://windows.php.net/download/).

The list of changes is recorded in the [ChangeLog](#). **18 Jan 2024** PHP 8.3.2 Released! The PHP development team announces the immediate availability of PHP 8.3.2. This is a bug fix release. All PHP 8.3 users are encouraged to upgrade to this version. For source downloads of PHP 8.3.2 please visit our downloads page,

Windows source and binaries can be found on [windows.php.net/download/](https://windows.php.net/download/).

The list of changes is recorded in the [ChangeLog](#). **21 Dec 2023** PHP 8.2.14 Released! The PHP development team announces the immediate availability of PHP 8.2.14. This is a bug fix release. All PHP 8.2 users are encouraged to upgrade to this version. For source downloads of PHP 8.2.14 please visit our downloads page,

Windows source and binaries can be found on [windows.php.net/download/](https://windows.php.net/download/).

The list of changes is recorded in the [ChangeLog](#). **21 Dec 2023** PHP 8.1.27 Released! The PHP development team announces the immediate availability of PHP 8.1.27. This is a bug fix release. All PHP 8.1 users are encouraged to upgrade to this version. For source downloads of PHP 8.1.27 please visit our downloads page,

Windows source and binaries can be found on [windows.php.net/download/](https://windows.php.net/download/).

The list of changes is recorded in the [ChangeLog](#). **21 Dec 2023** PHP 8.3.1 Released! The PHP development team announces the immediate availability of PHP 8.3.1. This is a bug fix release. All PHP 8.3 users are encouraged to upgrade to this version. For source downloads of PHP 8.3.1 please visit our downloads page,

Windows source and binaries can be found on [windows.php.net/download/](https://windows.php.net/download/).

The list of changes is recorded in the [ChangeLog](#). **23 Nov 2023** PHP 8.1.26 Released! The PHP development team announces the immediate availability of PHP 8.1.26. This is a bug fix release. All PHP 8.1 users are encouraged to upgrade to this version. For source downloads of PHP 8.1.26 please visit our downloads page,

Windows source and binaries can be found on [windows.php.net/download/](https://windows.php.net/download/).

The list of changes is recorded in the [ChangeLog](#). **23 Nov 2023** PHP 8.3.0 Released! The PHP development team announces the immediate availability of PHP 8.3.0. This release marks the latest minor release of the PHP language. PHP 8.3 comes with numerous improvements and new features such as: Typed Class Constants, Fetch class constant dynamically, syntax Readonly Amendments, Override Attribute, New Randomizer method, Randomizer::getBytesFromString, New function json\_validate and much much more... For source downloads of PHP 8.3.0 please visit our downloads page,

Windows source and binaries can be found on [windows.php.net/download/](https://windows.php.net/download/).

The list of changes is recorded in the [ChangeLog](#). The migration guide is available in the PHP Manual.

Please consult it for the detailed list of new features and backward incompatible changes. Kudos to all the contributors and supporters! **23 Nov 2023** PHP 8.2.13 Released! The PHP development team announces the immediate availability of PHP 8.2.13. This is a bug fix release. All PHP 8.2 users are encouraged to upgrade to this version. For source downloads of PHP 8.2.13 please visit our downloads page,

Windows source and binaries can be found on [windows.php.net/download/](https://windows.php.net/download/).

The list of changes is recorded in the [ChangeLog](#). **09 Nov 2023** PHP 8.3.0 RC 6 available for testing The PHP team is pleased to announce the release of PHP 8.3.0, RC 6.

This is the sixth and final release candidate, continuing the PHP 8.3 release cycle, the rough outline of which is specified in the PHP Wiki. For source downloads of PHP 8.3.0, RC 6 please visit the download page. Please carefully test this version and report any issues found in the bug reporting system. Please DO NOT use this version in production, it is an early test version. For more information on the new features and other changes, you can read the NEWS file or the UPGRADING file for a complete list of upgrading notes. These files can also be found in the release archive. The next release will be the production-ready, general availability release, planned for 23 November 2023. The signatures for the release can be found in the manifest on the QA site. Thank you for helping us make PHP better. **26 Oct 2023** PHP 8.1.25 Released! The PHP development team announces the immediate availability of PHP 8.1.25. This is a bug fix release. All PHP 8.1 users are encouraged to upgrade to this version. For source downloads of PHP 8.1.25 please visit our downloads page,

Windows source and binaries can be found on [windows.php.net/download/](https://windows.php.net/download/).

The list of changes is recorded in the [ChangeLog](#). **26 Oct 2023** PHP 8.2.12 Released! The PHP development team announces the immediate availability of PHP 8.2.12. This is a bug fix release. All PHP 8.2 users are encouraged to upgrade to this version. For source downloads of PHP 8.2.12 please visit our downloads page,

Windows source and binaries can be found on [windows.php.net/download/](https://windows.php.net/download/).

The list of changes is recorded in the [ChangeLog](#). **26 Oct 2023** PHP 8.3.0 RC 5 available for testing The PHP team is pleased to announce the release of PHP 8.3.0, RC 5.

This is the fifth release candidate, continuing the PHP 8.3 release cycle,

the rough outline of which is specified in the PHP Wiki. For source downloads of PHP 8.3.0, RC 5 please visit the download page. Please carefully test this version and report any issues found in the bug reporting system. Please DO NOT use this version in production, it is an early test version. For more information on the

new features and other changes, you can read the NEWSfile or the UPGRADINGfile for a complete list of upgrading notes. These files can also be found in the release archive. The next release will be the fourth release candidate (RC 5), planned for 26 October 2023. The signatures for the release can be found in the manifestor on the QA site. Thank you for helping us make PHP better. 12 Oct 2023 PHP 8.3.0 RC 4 available for testing. The PHP team is pleased to announce the release of PHP 8.3.0, RC 4.

This is the fourth release candidate, continuing the PHP 8.3 release cycle, the rough outline of which is specified in the PHP Wiki. For source downloads of PHP 8.3.0, RC 4 please visit the download page. Please carefully test this version and report any issues found in the bug reporting system. Please DO NOT use this version in production, it is an early test version. For more information on the new features and other changes, you can read the NEWSfile

or the UPGRADINGfile for a complete list of upgrading notes. These files can also be found in the release archive. The next release will be the fifth release candidate (RC 5), planned for 26 October 2023. The signatures for the release can be found in the manifestor on the QA site. Thank you for helping us make PHP better. 28 Sep 2023 PHP 8.1.24 Released! The PHP development team announces the immediate availability of PHP 8.1.24. This is a bug fix release. All PHP 8.1 users are encouraged to upgrade to this version. For source downloads of PHP 8.1.24 please visit our downloads page, Windows source and binaries can be found on windows.php.net/download/.

The list of changes is recorded in the ChangeLog. 28 Sep 2023 PHP 8.3.0 RC 3 available for testing. The PHP team is pleased to announce the release of PHP 8.3.0, RC 3.

This is the third release candidate, continuing the PHP 8.3 release cycle, the rough outline of which is specified in the PHP Wiki. For source downloads of PHP 8.3.0, RC 3 please visit the download page. Please carefully test this version and report any issues found in the bug reporting system. Please DO NOT use this version in production, it is an early test version. For more information on the new features and other changes, you can read the NEWSfile

or the UPGRADINGfile for a complete list of upgrading notes. These files can also be found in the release archive. The next release will be the fourth release candidate (RC 4), planned for 12 October 2023. The signatures for the release can be found in the manifestor on the QA site. Thank you for helping us make PHP better. 28 Sep 2023 PHP 8.2.11 Released! The PHP development team announces the immediate availability of PHP 8.2.11. This is a bug fix release. All PHP 8.2 users are encouraged to upgrade to this version. For source downloads of PHP 8.2.11 please visit our downloads page,

Windows source and binaries can be found on windows.php.net/download/.

The list of changes is recorded in the ChangeLog. 14 Sep 2023 PHP 8.3.0 RC 2 available for testing. The PHP team is pleased to announce the release of PHP 8.3.0, RC 2. This is the second release candidate, continuing the PHP 8.3 release cycle, the rough outline of which is specified in the PHP Wiki. For source downloads of PHP 8.3.0, RC 2 please visit the download page. Please carefully test this version and report any issues found in the bug reporting system. Please DO NOT use this version in production, it is an early test version. For more information on the new features and other changes, you can read the NEWSfile or the UPGRADINGfile for a complete list of upgrading notes. These files can also be found in the release archive. The next release will be the third release candidate (RC 3), planned for 28 September 2023. The signatures for the release can be found in the manifestor on the QA site. Thank you for helping us make PHP better. 31 Aug 2023 PHP 8.1.23 Released! The PHP development team announces the immediate availability of PHP 8.1.23. This is a bug fix release. All PHP 8.1 users are encouraged to upgrade to this version. For source downloads of PHP 8.1.23 please visit our downloads page,

Windows source and binaries can be found on windows.php.net/download/.

The list of changes is recorded in the ChangeLog. 31 Aug 2023 PHP 8.2.10 Released! The PHP development team announces the immediate availability of PHP 8.2.10. This is a bug fix release. All PHP 8.2 users are encouraged to upgrade to this version. For source downloads of PHP 8.2.10 please visit our downloads page, Windows source and binaries can be found on windows.php.net/download/.

The list of changes is recorded in the ChangeLog. 31 Aug 2023 PHP 8.3.0 RC 1 available for testing. The PHP team is pleased to announce the release of PHP 8.3.0, RC 1.

This is the first release candidate, continuing the PHP 8.3 release cycle, the rough outline of which is specified in the PHP Wiki. For source downloads of PHP 8.3.0, RC 1 please visit the download page. Please carefully test this version and report any issues found in the bug reporting system. Please DO NOT use this version in production, it is an early test version. For more information on the new features and other changes, you can read the NEWSfile

or the UPGRADINGfile for a complete list of upgrading notes. These files can also be

found in the release archive. The next release will be the second release candidate (RC 2), planned

for 14 September 2023. The signatures for the release can be found in the manifestor on the QA site. Thank you for helping us make PHP better. 17 Aug 2023 PHP 8.3.0 Beta 3 available for testing. The PHP team is pleased to announce the third beta release of PHP 8.3.0, Beta 3.

This continues the PHP 8.3 release cycle, the rough outline of which is specified in the PHP Wiki. For source downloads of PHP 8.3.0 Beta 3 please visit the download page. Please carefully test this version and report any issues found in the bug reporting system. Please DO NOT use this version in production, it is an early test version. For more information on the new features and other changes, you can read the NEWSfile,

or the UPGRADINGfile for a complete list of upgrading notes. These files can also be found in the release archive. The next release will be RC 1, planned for Aug 31 2023. The signatures for the release can be found in the manifestor on the QA site. Thank you for helping us make PHP better. 16 Aug 2023 PHP 8.2.9 Released! The PHP development team announces the immediate availability of PHP 8.2.9. This is a security release. All PHP 8.2 users are encouraged to upgrade to this version. Windows source and binaries are not synchronized and do not contain a fix for GH-11854. For source downloads of PHP 8.2.9 please visit our downloads page,

Windows source and binaries can be found on windows.php.net/download/.

The list of changes is recorded in the ChangeLog. 04 Aug 2023 PHP 8.0.30 Released! The PHP development team announces the immediate availability of PHP 8.0.30. This is a security release. All PHP 8.0 users are encouraged to upgrade to this version. For source downloads of PHP 8.0.30 please visit our downloads page, Windows source and binaries can be found on windows.php.net/download/.

The list of changes is recorded in the ChangeLog. 03 Aug 2023 PHP 8.3.0 Beta 2 available for testing. The PHP team is pleased to announce the second beta release of PHP 8.3.0, Beta 2.

This continues the PHP 8.3 release cycle, the rough outline of which is specified in the PHP Wiki. For

source downloads of PHP 8.3.0 Beta 2 please visit the [download](#) page. Please carefully test this version and report any issues found in the [bug reporting system](#). Please DO NOT use this version in production, it is an early test version. For more information on the new features and other changes, you can read the [NEWSfile](#),

or the [UPGRADINGfile](#) for a complete list of upgrading notes. These files can also be found in the [release archive](#). The next release will be Beta 3, planned for Aug 17 2023. The signatures for the release can be found in the [manifestor](#) on the QA site. Thank you for helping us make PHP better. 03 Aug 2023 PHP 8.1.22 Release d! The PHP development team announces the immediate availability of PHP 8.1.22. This is a security release. All PHP 8.1 users are encouraged to upgrade to this version. For source downloads of PHP 8.1.22 please visit our [downloads](#) page,

Windows source and binaries can be found on [windows.php.net/download/](#).

Now we have a clean text from the crawled web page. Awesome, right? Finally, let's convert that text into tokens by splitting the text like this:

```
In [13]: #code block 4
#split the text into tokens
tokens = [t for t in text.split()]
print(tokens)
clean_tokens = tokens[:]
#print(clean_tokens)
```

**Stopwords** are commonly used words that are filtered out from text during text preprocessing in natural language processing (NLP) tasks. These words are considered to be of little value in many NLP analyses because they are very frequent and don't carry significant meaning by themselves. Filtering out stopwords can help improve the efficiency of text analysis and reduce noise in the data.

Examples of stopwords in English include words like "the," "and," "is," "of," "in," "to," "for," "that," and so on.

**Count word frequency** The text is much better now. Let's calculate the frequency distribution of those tokens using Python NLTK. There is a function in NLTK called FreqDist() does the job:

In [14]: *#code block 5*

```
#remove the simpe repetitive english words using stopwords
sr = stopwords.words('english')
for token in tokens:
    if token in stopwords.words('english'):
        clean_tokens.remove(token)
```

```
freq = nltk.FreqDist(clean_tokens)
#del_tokens = freq.copy()
```

If you search the output, you'll find that the most frequent token is PHP. You can plot a graph for those tokens using plot function like this:

```
In [15]: #code block 6
#print and plot the 10 tokens with high frequency
for key,val in freq.items():
    print (str(key) + ':' + str(val))
freq.plot(10,cumulative=False)
```

## BAR GRAPH REPRESENTATION

```
In [17]: #EXAMPLE

import nltk
nltk.download('punkt') # Download necessary data
from nltk.tokenize import word_tokenize
import matplotlib.pyplot as plt
from collections import Counter

# Sample text
text = "NLTK is a powerful library for natural language processing. NLTK provides tools for text analysis."

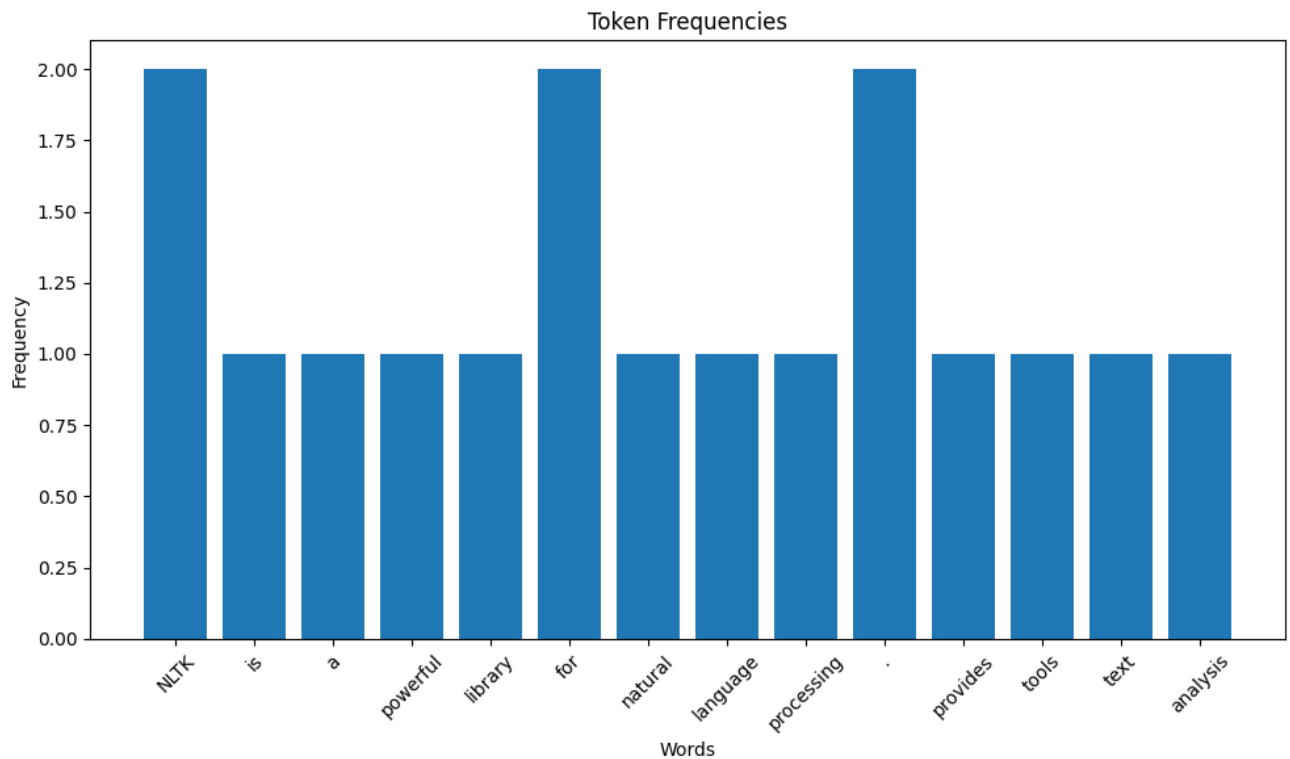

# Tokenize the text
tokens = word_tokenize(text)

# Count word frequencies
word_counts = Counter(tokens)
print(word_counts)
# Separate words and their frequencies
words = list(word_counts.keys())
frequencies = list(word_counts.values())

# Create a bar graph
plt.figure(figsize=(10,6))
plt.bar(words, frequencies)
plt.xlabel('Words')
plt.ylabel('Frequency')
plt.title('Token Frequencies')
plt.xticks(rotation=45)

# Display the graph
plt.tight_layout()
plt.show()
```

```
[nltk_data] Downloading package punkt to /root/nltk_data...
[nltk_data] Package punkt is already up-to-date!
Counter({'NLTK': 2, 'for': 2, 'is': 1, 'a': 1, 'powerful': 1, 'library': 1, 'natural': 1, 'language': 1, 'processing': 1, 'provides': 1, 'tools': 1, 'text': 1, 'analysis': 1})
```

Work on **code block 2** and use the same code concept below to parse data from any live website that talk about SpaceX Technologies and plot any graph for those tokens of your own choice which is not given above.

Note: Please keep in mind that do not put all code in one block split in a fashionable way.

```
In [18]: #CODE HERE
#code block 2

import urllib.request

#open and read the spacex data
# response = urllib.request.urlopen('https://blogs.nasa.gov/spacex/')
# response = urllib.request.urlopen('https://www.space.com/spacex-launch-144-missions-2024')
response = urllib.request.urlopen('https://historicspacecraft.com/Rockets_SpaceX.html')

html = response.read()
print(html)
```

Both stages are fueled with RP-1 kerosene and liquid oxygen. \r\n<div>The first stage is propelled by nine Merlin engines, while the second stage uses a single Merlin engine modified for use in the upper stage.</div>\r\n<p>SpaceX builds both stages in-house at their production facility in Hawthorne, California. \r\n<div>Stages are test-fired at a facility near McGregor, Texas, before shipping to Cape Canaveral or Vandenberg Air Force base for launch.</div>\r\n<p>The first Falcon 9 orbital mission was flown in June 2010.</p>\r\n<p>SpaceX is developing technology to allow reuse of Falcon rocket first stages.</p>\r\n\r\n <h3>Falcon 9 v1.1</h3>\r\n<p>First flown in September, 2013, The Falcon 9 version 1.1 (right) featured significantly improved performance. \r\n<div>Upgrades included lengthened propellant tanks, upgraded engines, and a new thrust structure.</div>\r\n<div>The first stage was designed to perform a controlled reentry and propulsive landing after completing its mission.</div>\r\n<p>The first stage rocket arrangement changed from a three-by-three grid layout to a circular layout of eight engines surrounding a center engine.</p>\r\n<p>Fifteen Falcon 9 1.1 rockets flew before being replaced by the improved Falcon 9 FT.</p>\r\n\r\n <h3>Falcon 9 FT</h3>\r\n<p>The Falcon 9 FT, sometimes referred to as "Full Thrust" or version 1.2, was first flown in December 2015. \r\n<div>Fuel capacity was increased through the use of densified propellants and a slightly stretched second stage. \r\n<div>The upgrade also incorporated upgraded engines and improved landing legs.</div>\r\n<h3>Falcon 9 Block-5</h3>\r\n<p>First flown in May, 2018, the Falcon 9 Block-5 incorporated modifications allowing more easier re-use of the first stage.</p>\r\n\r\n <h3>Falcon 9 First Stage Recovery Testing</h3>\r\n <figure class="right" style="width:302px;"> <a href="Diagrams/R/Falcon-9\_Reuse\_RK2016\_800x800.png"></a> <figcaption><b>First Stage Recovery Tests</b><br />Left to right, Grasshopper, Falcon 9R, Falcon 9FT launch configuration and after recovery.<br /><a href="Diagrams/R/Falcon-9\_Reuse\_RK2016\_800x800.png">View Larger Version</a></figcaption></figure>\r\n<p>SpaceX has always believed rocket reuse was important for achieving their future goals. \r\n<div>When experiments using parachute aided recovery, conducted on early Falcon missions, \r\n<div>they were not successful, plans were made to investigate propulsive landing.</div>\r\n<p>To conduct propulsive landing experiments, a pair of test vehicles, known as <b>Grasshopper</b> and <b>Falcon 9R</b> \r\n<div>were built and tested at the SpaceX facility in McGregor Texas.</div>\r\n<p>The first successful stage recovery, on an operational mission, occurred in December 2015 at Cape Canaveral Air Force Station.</p>\r\n\r\n <h4>Boost Back Burn</h4>\r\n<p>On missions attempting to return to launch site, a boost back burn is performed. \r\n<div>After stage separation, the first stage uses gas jets to flip over, orienting itself toward its landing site. \r\n<div>A main engine burn is conducted to cancel the downrange momentum and propel the rocket toward the planned landing site.</div>\r\n<h4>Reentry Burn</h4>\r\n<p>As the rocket falls toward the atmosphere, the stage reorients itself to point its engines into the direction of flight. \r\n<div>A burn is conducted to slow the rocket's descent, reducing atmospheric heating. \r\n<div>As denser atmosphere is encountered, four grid fins, located on the interstage, help control the rocket's attitude and trajectory.</div>\r\n<h4>Landing Burn</h4>\r\n<p>The rocket is in free-fall for most of the descent through the atmosphere. \r\n<div>As the landing site is neared, a final burn is initiated to slow the rocket. \r\n<div>Seconds before touchdown, four landing legs are deployed.</div>\r\n\r\n <h4>Landing Sites</h4>\r\n<p>When fuel margins are sufficient, a boost-back burn and return to launch site landing is possible. \r\n<div>However some missions, such as those launching heavy GTO payloads, may have insufficient fuel margins to conduct the boost-back burn. \r\n<div>In these cases, recovery may be accomplished

downrange by landing on specially constructed drone ships at sea.

Early landing experiments, with operational boosters, occurred at sea. Either over open ocean, or on drone ships.

The first successful landing occurred on land at Landing Zone 1 at Cape Canaveral.

The East coast drone ship, servicing missions launched from Cape Canaveral Air Force Station and Kennedy Space Center, is named "Of Course I Still Love You".

On the West coast, "Just Read The Instructions" supports mission launched from Vandenberg Air Force Base.

Dragon Spacecraft

Dragon Spacecraft

A frequent payload for Falcon 9 is the Dragon spacecraft.

Developed in conjunction with NASA's Commercial Orbital Transportation Services (COTS) program, the Dragon capsule is capable of carrying both pressurized and unpressurized cargo to the International Space Station.

At the end of each mission, the spacecraft can return pressurized cargo back to Earth.

Crew Dragon Capsule

Crew Dragon was developed as part of NASA's Commercial Crew Development (CC Dev) program and is used to transport astronauts to the International Space Station.

An orbital test flight, including docking at the ISS, was successfully completed in March, 2019.

The first crewed mission to the ISS, SpX-DM2, was launched in May, 2020.

SpaceX Falcon Heavy illustration

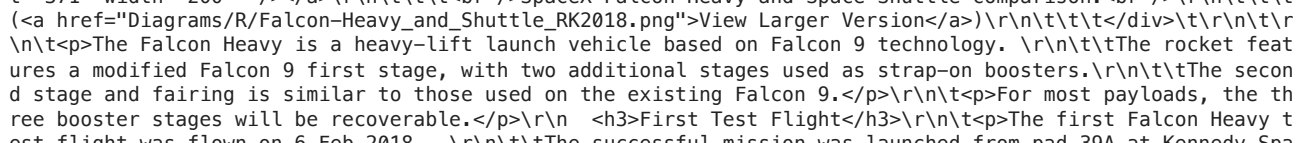

Illustration showing comparison of Falcon Heavy and Space Shuttle.

SpaceX Falcon Heavy and Space Shuttle comparison.

View Larger Version

The Falcon Heavy is a heavy-lift launch vehicle based on Falcon 9 technology. The rocket features a modified Falcon 9 first stage, with two additional stages used as strap-on boosters. The second stage and fairing is similar to those used on the existing Falcon 9.

For most payloads, the three booster stages will be recoverable.

First Test Flight

The first Falcon Heavy test flight was flown on 6 Feb 2018. The successful mission was launched from pad 39A at Kennedy Space Center and placed the payload, a Tesla roadster, into a heliocentric orbit with an aphelion beyond the orbit of Mars.

Attempts were made to recover all three boosters. Each of the side boosters returned to successful landings at Cape Canaveral. The planned core stage landing, on a barge at sea, failed.

Both side boosters were making their 2nd flight, each having launched payloads on previous missions.

### Future Uses

Future payloads may include large communications satellites, Department of Defense payloads, and interplanetary missions.

SpaceX headquarters, as well as production facilities and mission control, are located in Hawthorne, California.

The company operates rocket testing facilities near McGregor, Texas and near Brownsville, Texas.

SpaceX currently operates launch pads at Kennedy Space Center, Cape Canaveral and Vandenberg Air Force base.

Early Falcon 1 test flights occurred at Kwajalein Atoll in the Pacific Ocean. In addition to launch vehicles, SpaceX has developed the Dragon space station re-supply vehicle.

The company has a contract with NASA to periodically fly supplies to the International Space Station. SpaceX has developed a three-core rocket known as the Falcon Heavy.

The large rocket includes three modified Falcon 9 first stages and is one of the most powerful rockets currently in service. The company has also developed a crewed spacecraft, known as Crew Dragon.

Crew Dragon was developed as part of NASA's Commercial Crew Development (CCDev) program and is used to transport astronauts to the International Space Station. For more information, visit the SpaceX website. Left to right: Falcon 1, Falcon 9, Falcon 9 v1.1, Falcon 9 v1.1 with Dragon, Falcon 9 FT with payload fairing, Falcon 9 FT with Dragon, Falcon 9 Block-5 with payload fairing, Falcon 9 Block-5 with Crew Dragon, Falcon Heavy, Human figure for scale (1.8m tall), Grasshopper test vehicle, Falcon 9R test vehicle, Falcon 9 FT recovered stage. Falcon 1 The two-stage Falcon 1 rocket used RP-1 and LOX as propellants. A single Merlin engine powered the first stage, while a Kestrel engine powered the second stage. Both engines were designed and built by SpaceX. Five Falcon 1 rockets were launched between 2006 and 2009. The first three flights ended in failure, while the last two were successful. All flights were launched from Kwajalein Atoll in the Pacific Ocean. Falcon 9 Falcon 9 is a two stage space launch vehicle developed by SpaceX. Both stages are fueled with RP-1 kerosene and liquid oxygen.

The first stage is propelled by nine Merlin engines, while the second stage uses a single Merlin engine modified for use in the upper stage. SpaceX builds both stages in-house at their production facility in Hawthorne, California.

Stages are test-fired at a facility near McGregor, Texas, before shipping to Cape Canaveral or Vandenberg Air Force base for launch. The first Falcon 9 orbital mission was flown in June 2010. SpaceX is developing technology to allow reuse of Falcon rocket first stages. Falcon 9 v1.1 First flown in September, 2013, The Falcon 9 version 1.1 (right) featured significantly improved performance.

Upgrades included lengthened propellant tanks, upgraded engines, and a new thrust structure.

The first stage was designed to perform a controlled reentry and propulsive landing after completing its mission. The first stage rocket arrangement changed from a three-by-three grid layout to a circular layout of eight engines surrounding a center engine. Fifteen Falcon 9 1.1 rockets flew before being replaced by the improved Falcon 9 FT. Falcon 9 FT The Falcon 9 FT, sometimes referred to as "Full Thrust" or version 1.2, was first flown in December 2015.

Fuel capacity was increased through the use of densified propellants and a slightly stretched second stage.

The upgrade also incorporated upgraded engines and improved landing legs. Falcon 9 Block-5 First flown in May, 2018, the Falcon 9 Block-5 incorporated modifications allowing more easier re-use of the first stage. Falcon 9 First Stage Recovery Testing First Stage Recovery Tests Left to right, Grasshopper, Falcon 9R, Falcon 9 FT launch configuration and after recovery. (View Larger Version) SpaceX has always believed rocket reuse was important for achieving their future goals.

When experiments using parachute aided recovery, conducted on early Falcon missions,

were not successful, plans were made to investigate propulsive landing. To conduct propulsive landing experiments, a pair of test vehicles, known as Grasshopper and Falcon 9R, were built and tested at the SpaceX facility in McGregor, Texas. The first successful stage recovery, on an operational mission, occurred in December 2015 at Cape Canaveral Air Force Station. Boost Back Burn On missions attempting to return to launch site, a boost back burn is performed.

After stage separation, the first stage uses gas jets to flip over, orienting itself toward its landing site.

A main engine burn is conducted to cancel the downrange momentum and propel the rocket toward the planned landing site. Reentry Burn As the rocket falls toward the atmosphere, the stage reorients itself to point its engines into the direction of flight.

A burn is conducted to slow the rocket's descent, reducing atmospheric heating.

As denser atmosphere is encountered, four grid fins, located on the interstage, help control the rocket's attitude and trajectory. Landing Burn The rocket is in free-fall for most of the descent through the atmosphere.

As the landing site is neared, a final burn is initiated to slow the rocket.

Seconds before touchdown, four landing legs are deployed. Landing Sites When fuel margins are sufficient, a boost-back burn and return to launch site landing is possible.

However some missions, such as those launching heavy GTO payloads, may have insufficient fuel margins to conduct the boost-back burn.

In these cases, recovery may be accomplished downrange by landing on specially constructed drone ships at sea. Early landing experiments, with operational boosters, occurred at sea. Either over open ocean, or on drone ships.

The first successful landing occurred on land at Landing Zone 1 at Cape Canaveral. The East c

oast drone ship, servicing missions launched from Cape Canaveral Air Force Station and Kennedy Space Center, is named "Of Course I Still Love You". On the West coast, "Just Read The Instructions" supports mission launch ed from Vandenberg Air Force Base. SpaceX Dragon SpacecraftDragon SpacecraftA frequent payload for Falcon 9 i s the Dragon spacecraft.

Developed in conjunction with NASA's Commercial Orbital Transportation Services (COTS) progra m,

the Dragon capsule is capable of carrying both pressurized and unpressurized cargo to the In ternational Space Station.

At the end of each mission, the spacecraft can return pressurized cargo back to Earth. SpaceX Crew Dragon SpacecraftCrew Dragon SpacecraftCrew Dragon was developed as part of NASA's Commercial Crew Devel opment (CCDev) program and is used to transport astronauts to the International Space Station. An orbital test flight, including docking at the ISS, was successfully completed in March, 2019.

The first crewed mission to the ISS, SpX-DM2, was launched in May, 2020. The rocket features a modified Falcon 9 first stage, with two additional stages used as stra

p-on boosters.

The second stage and fairing is similar to those used on the existing Falcon 9. For most payloads, the three booster stages will be recoverable. First Test Flight The first Falcon Heavy test flight was flown on 6 Feb 2018.

The successful mission was launched from pad 39A at Kennedy Space Center and placed the payload,

a Tesla roadster, into a heliocentric orbit with an aphelion beyond the orbit of Mars.

Attempts were made to recover all three boosters. Each of the side boosters returned to successful landings at Cape Canaveral.

The planned core stage landing, on a barge at sea, failed.

Both side boosters were making their 2nd flight, each having launched payloads on previous missions. Future Uses Future payloads may include large communications satellites, Department of Defense payloads, and interplanetary missions. - The above code splits the text into tokens.
- Each individual word is called as token.

In [21]: *#code block 5*

```
#remove the simple repetitive english words using stopwords
sr = stopwords.words('english')
for token in tokens:
    if token in stopwords.words('english'):
        clean_tokens.remove(token)
freq = nltk.FreqDist(clean_tokens)
#del_tokens = freq.copy()
```

- The above code is to remove all the repetitive words which are called stopwords.

In [22]: *#code block 6*  
*#print and plot the 10 tokens with high frequency*

```
for key, val in freq.items():
    print (str(key) + ':' + str(val))
freq.plot(10, cumulative=False)
```

```

- Store and print the top 10 most frequently occurring words on the webpage.

```
In [25]: import seaborn as sns
import matplotlib.pyplot as plt

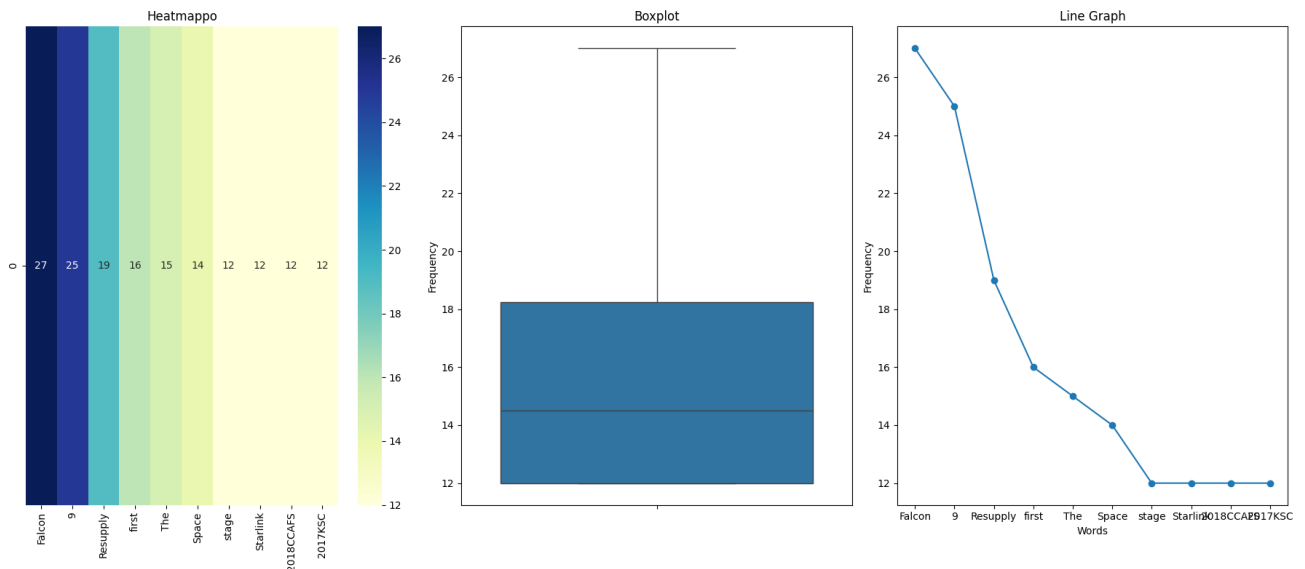

# Heatmap, Boxplot, and Line Graph for the top 10 word frequency distribution
plt.figure(figsize=(18, 8))

# Heatmap
plt.subplot(1, 3, 1)
sns.heatmap([[freq[word] for word in top_10_words]], cmap='YlGnBu', annot=True, xticklabels=top_10_words)
plt.title('Heatmap')

# Boxplot
plt.subplot(1, 3, 2)
sns.boxplot(top_10_frequencies, orient='v')
plt.title('Boxplot')
plt.ylabel('Frequency')

# Line Graph
plt.subplot(1, 3, 3)
plt.plot(top_10_words, top_10_frequencies, marker='o')
plt.title('Line Graph')
plt.xlabel('Words')
plt.ylabel('Frequency')

plt.tight_layout()
plt.show()
```

- Above is the Heatmap, Boxplot, and Scatter Plot for the top 10 most frequently occurring words in the website.

## What do you understand by the tutorial. Explain briefly?

-->

- Natural Language Processing is making a machine/computer understand human language.
- To do that we need to structure the language.

- Converting Unstructured data to structured is called Natural Language Understanding.
- Converting the data from structured to unstructured is referred to as Natural Language Generation.
- Breaking down the text into words is called tokenization and each word is referred to as a token.
- The first thing that we do in NLP is tokenization.
- We can use Open Source Libraries like Spacy for Tokenization and Lemmatization.
- Lemmatization is taking the words and understanding the dictionary meaning, then deriving its root/LEM.
- NLTK also known as Natural Language Toolkit is a library used in Natural Language Processing for text processing.
- NLTK can be used to generate tokens. Tokens can be each word or tokens can be every sentence.
- Gensim is an open-source library that is used to handle large amounts of data efficiently to recognize complex patterns in them.
- BeautifulSoup is another library that is used to extract information/text from HTML/XML documents by providing different methods that can identify tags and remove them.
- Stopwords are common English words like 'is', 'to', 'for', etc. These words occur frequently, so to improve the efficiency stopwords are removed.
- After removing the StopWords and calculating the frequency of each word we can also plot the frequencies using different visualizations like line graphs, box plots, scatter plots, pie charts, etc.
